How to Prepare for Your New Ductless Installation

1. Clear the Way!

Keep a clear path to where the ductless mini split service crew will be working. We need as much space as possible to work in where we will be installing the components of your new ductless mini split. Cleaning the pathway to the install locations can help speed up the installation process. It also makes the area safer for us to work in if you remove all potential tripping hazards. If it is necessary for us to travel through narrow hallways or spaces to install the ductless system, remove any objects in the path or pictures on the walls.

2. Be There

If possible, free up your schedule to be sure you can be available during the times your new ductless mini split installation is being performed. The job can take anywhere from a few hours to a couple of days. You will not need to do any part of the installation, but it is still best to be available during all parts of the ductless installation process. This will also allow our installers an opportunity to give you a tour of your new ductless system and offer you pointers on how to operate it best. Speak with us about scheduling the installation according to times that will work best for you.

3. Think Ahead

Be sure to learn about the Wi-Fi programmable thermostat options that your ductless system may include. If available, you can download the app that will allow you to control the temperature output of your ductless system from your cell phone and have it ready to set up with the mini split installation crew.
