

How to Prepare for Your New Geothermal Installation

1. Clear the Way!
Keep a clear path to where the geothermal crew will be working. Geothermal systems are often large and difficult to maneuver. We need as much space as possible to replace your old HVAC system. Cleaning the pathway to where the geothermal heat pump will be installed can help speed up the installation process. It also makes the area safer for us to work in if you remove all potential tripping hazards. If it is necessary for us to travel throug narrow hallways or spaces to install the new geothermal system, remove any objects in the path or pictures on the walls.
2. Be There

If possible, free up your schedule to be sure you can be available during the times your new geothermal heat pump installation is being performed. The job can take 6 - 8 weeks to complete. You will not need to do any part of the installation, but it is still best to be available as much as possible for all parts of the geothermal installation process. This will also allow our installers to give you a tour of your new geothermal system and offer you pointers on how to operate it best. Speak with us about scheduling the installation according to times that will work best for you.

3. Mow Your Grass Since the geothermal installation crew will be working in your yard for some time, you may want to cut the grass in your yard close to the time before the installation crew is scheduled

to start digging to install the geothermal loop system.

You can ensure the temperature in your home is at an ideal temperature for comfort and energy efficiency, even when you are away, with a programmable thermostat. Be sure to ask about the thermostat that your new geothermal heat pump includes. Find out about the Wi-Fi programmable thermostats options we have available that will allow you to control your home temperature from an app on your cell phone. Call (412) 489-4745 to

learn about the options we have available.

Take this time to consider adding an in-line humidifier to your new geothermal HVAC system. In colder months, the air inside and outside of your home is dry, this lack of moisture results in dry skin and chapped lips. Adding moisture back with a humidifier will make your home feel warmer at lower temperatures. As a result, it will lower your heating bill as well. Call (412) 489-4745 to learn about the options we have available.
